

You're Not Behind. You're Stuck.

A practical framework for understanding where your network operations team is — and how to move forward.

WHO WE ARE

NetBrain is the leader in Agentic NetOps.

Hundreds

Enterprise Customers

Finance, healthcare, telecom and critical infrastructure worldwide

NOW

AI Agents in Production

Diagnosing and resolving in LIVE enterprise environments today

Deep

Network Expertise

Built for enterprise networks from the ground up

I work with network operations teams every day. Let's talk about what I hear.

NetBrain

How many of you have some form of automation running today?

How many of you still have your best engineers triaging the same incidents they were two years ago?

Every Team Tells the Same Story

"We built the runbooks. Then, when the house is on fire, few, if any, run them."

"We have dashboards. Yet alerts are seen as noise."

"We want to leverage AI. But we're not sure where it fits or how to trust it."

*Every one of these is a symptom of the same problem. The industry just hasn't named it.
Until Now.*

Agentic NetOps Adoption

Where does your team operate today?

Aware

- Live network visibility
- Topology and dependencies
- Knowledge not only in Engineer's heads

Enabled

- Repeatable workflows
- AI assists
- Humans decide

Proactive

- Drift detected before outage
- AI recommends
- System earns trust

Autonomous

- Act within policy
- Humans govern outcomes
- Exceptions only

Several cycles on root cause analysis. One prompt. Resolved in 25 minutes. "Why can't site x browse out of their xx circuit?"

Another tried Claude first. NetBrain went further. Analyzed the logs, identified a hardware fault, recommended Cisco TAC.

The Plateaus are the Real Problem

The Visibility Plateau

It feels like:

Your monitoring is good. Alerts are firing. Dashboards are green.

The reality:

Alerts everywhere. Context nowhere. Your best engineer is still the system

The Automation Ceiling

It feels like:

You have runbooks. You have scripts. You've automated a lot.

The reality:

Nobody runs them during an actual crisis.

Trust in Intelligent Systems

It feels like:

AI is doing useful things in demos and pilots.

The reality:

When the pressure is on, the team goes back to what they know.

Getting stuck here is not a failure of effort. It is a failure of orientation. You cannot move forward if you do not know where you are.

AI is not the Destination

It is the catalyst for wherever you are right now.

Aware

AI cuts through alert noise and builds context across the environment so your team sees the right signal at the right time.

Enabled

AI accelerates investigation, surfaces root cause faster, and lets junior engineers operate at senior capability.

Proactive

AI becomes the evaluation layer for automation that already exists, catching drift before it becomes an incident.

Autonomous

AI acts within the guardrails your team defines. It operates. Humans govern the outcome.

The stage determines the job. The job determines how AI fits.

The question is not whether AI belongs in your network operations.

It does.

The question is whether you know where you are well enough to use it well.

That starts with knowing where you stand.
